#### Input/output in Fortran

Victor Eijkhout, Susan Lindsey

Fall 2019

# Formatted and unformatted I/O

- Formatted: ascii output. This is good for reporting, but not for numeric data storage.
- Unformatted: binary output. Great for further processing of output data.
- Beware: binary data is machine-dependent. Use hdf5 for portable binary.

# I/O commands

- Print simple output to terminal
- Write output to terminal or file ('unit')
- Read input from terminal or file
- Open, Close for files and streams
- Format format specification that can be used in multiple statements.

# Simple print

#### All on one line:

```
print *,"The result is",result
print *,item1,item2,item3
```

## Implicit do loops

Parametrized printing with an implicit do loop:

All values will be printed on the same line.

## **Array printing**

- print \*,A prints whole array, column-major
- Implicit do loops:

```
print *,( A(i,i),i=1,n)
```

Can also be nested.

#### **Formats**

- Fine control of input/output.
- Direct use in print statement:

```
print '(a6,3f5.3)',"Result",x,y,z
print '("Result:",3f5.3)',x,y,z
```

Format statement:

```
print 10,"result:",x,y,z
10 format('(a6,3f5.3)')
```

### Format specifiers

- 'an' specifies a string of *n* characters. If the actual string is longer, it is truncated in the output.
- 'in' specifies an integer of up to n digits. If the actual number takes more digits, it is rendered with asterisks.
- 'f m.n' specifies a fixed point representation of a real number, with m total positions (including the decimal point) and n digits in the fractional part.
- 'em.n' Exponent representation.
- Strings can go into the format:

```
print '("Result:",3f5.3)',x,y,z
```

• 'x' for a space, '/' for newline

### Format repetitions

```
print '( 3i4 )', i1,i2,i3
print '( 3(i2,":",f7.4) )', i1,r1,i2,r2,i3,r2
```

#### Repeats and line breaks

- If abc is a format string, then 10(abc) gives 10 repetitions.
   There is no line break.
- If there is more data than specified in the format, the format is reused in a new print statement. This causes line breaks.
- The / (slash) specifier causes a line break.
- There may be a 80 character limit on output lines.

#### Exercise 1

Use formatted I/O to print the number  $0 \cdots 99$  as follows:

```
0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 51 52 53 54 55 56 57 58 59 60 61 62 63 64 65 66 67 68 69 70 71 72 73 74 75 76 77 78 79 80 81 82 83 84 85 86 87 88 89 90 91 92 93 94 95 96 97 98 99
```
